Introduction to Web Development
Personal Project Brief

Your task is to create a personal web site. It can be on any topic you choose (hobby, family, interest..) but should include the following elements:

- A home page that introduces the site and links to the other pages.
- Three or more other pages with content including text and pictures. These pages must also link back to the home page and each other.
- A layout and style defined using CSS external Style sheets.
- One of the pages should have a form that will allow the input of user information and validate this information using JavaScript.
- At least one page must have a list.
- Pictures should include appropriate alt text for accessibility

The website should be designed in line with the design instruction you have received taking into account user interaction, standards, colour theory and layout.

The website should be created as a new repl on Repl.it. this will allow the site to be shared with others if you wish.

You will have two sessions to work on the site and whatever additional time you wish to put into this at home.

This is an individual exercise.
